

REVISION OF OCHROSIA (APOCYNACEAE) IN MALESIA

HENDRIAN

Bogor Botanic Garden, Indonesian Institute of Sciences,
Jalan Ir. H. Juanda 13, Bogor, Indonesia

SUMMARY

The genus *Ochrosia* Juss. is revised in the Malesian region. Thirteen species are recognized as *Ochrosia*, including one new species, *O. basistamina*. Seven species previously placed in *Neisosperma* Raf. are now included in *Ochrosia*.

The names *Ochrosia* section *Echinocaryon* F. Muell. and *Ochrosia* section *Ochrosia* are applied for the fibrous-fruited species and cavity-fruited species of *Ochrosia*, respectively. *Neisosperma* Raf. is reduced to *Ochrosia* section *Echinocaryon* F. Muell.

Separate keys are given for the species of both sections.

Key words: *Neisosperma*, *Ochrosia*, *Ochrosia* section *Echinocaryon*, *Ochrosia* section *Ochrosia*, Malesia, taxonomic revision.

INTRODUCTION

The history

In the most recent classification of the Apocynaceae by Endress & Bruyns (2000) the genus *Ochrosia* is placed in the tribe Vinceae of the subfamily Rauvolfioideae. The tribe is characterized mainly by the possession of unadorned seeds, a basal-collared style head and corolla lobes which are usually sinistrorsely contorted, except in *Kopsia*, *Ochrosia*, and *Neisosperma*.

Ochrosia was proposed by De Jussieu in his *Genera Plantarum* (1789), without any description or type indicated, on the ‘bois jaune’ collected by Commerson in Bourbon (= Réunion). This plant was preserved in P (*Herb. Jussieu no. 7170*) (Boiteau et al., 1974). It was given a specific name in 1791 by Gmelin: *Ochrosia borbonica*, which is a nomen nudum. This epithet was antedated by *O. maculata* Jacq. (1791), also based on a specimen collected from Bourbon (Markgraf, 1979).

Delimitation of the genus was soon found to be problematic. As more species were discovered botanists became aware of fruit differences within the genus. It was Mueller (1871) who first used this character to discern two sections: *Ochrosia* section *Lactaria* with a massive, thick endocarp containing two lateral cavities filled with spongy tissue, and *Ochrosia* section *Echinocaryon* with an endocarp split into diverging fibres.

This classification was followed by Valeton (1895) (at subgeneric level) who put *O. elliptica* Labill., *O. calocarpa* (Hassk.) Miq. (= *O. elliptica* Labill.), *O. ackeringae* (Teijsm. & Binn.) Miq., *O. coccinea* (Teijsm. & Binn.) Miq., *O. moorei* (F. Muell.) F. Muell., and *O. sandwichensis* Hillebr. (*O. sandwichensis* var. β Hillebr. = *O. compta* K. Schum.) (which are all cavity-fruited species) under *Ochrosia* subgenus *Lactaria* F. Muell., and *O. salubris* Blume (= *O. oppositifolia* (Lam.) K. Schum.), *O. kilneri*

Fig. 1. Two fruit types of *Ochrosia*. a. Fibrous-fruited type; b. cavity-fruited type.

F. Muell., *O. acuminata* Trimen ex Valeton, and *O. glomerata* (Blume) F. Muell. (which are all fibrous-fruited species (Fig. 1)) under *Ochrosia* subgenus *Echinocaryon* F. Muell. But he incorrectly placed *O. borbonica* J.F. Gmel. (which is a cavity-fruited species (Fig. 1)) into *Ochrosia* subgenus *Echinocaryon* F. Muell.

At the generic level, the cavity-fruited species have been placed in the genus *Bleekeria* Hassk. and in *Excavatia* Markgr. Hasskarl (1855) proposed *Bleekeria* with 2 species, *B. kalokarpa* Hassk. and *B. salubris* Hassk. The concept of this genus was rather confusing. The generic description applied to the cavity-fruited species but also included *Bleekeria salubris* Hassk. (= *O. oppositifolia* (Lam.) K. Schum.) which is a fibrous-fruited species. In 1923 the genus was emended by Koidzumi who took out *Bleekeria salubris* and moved it into *Lactaria* Rumph. ex Raf. He then added some other cavity-fruited species into *Bleekeria*. In 1927 Markgraf proposed *Excavatia* with 3 cavity-fruited species: *E. litoralis* (Merr.) Markgr. (= *O. ackeringae* (Teijsm. & Binn.) Miq., *E. coccinea* (Teijsm. & Binn.) Markgr. (= *O. coccinea* (Teijsm. & Binn.) Miq.) and *E. mariannensis* (A.DC.) Markgr. (= *O. mariannensis* A.DC.).

Conversely Pichon (1947) kept the cavity-fruited species as the true *Ochrosia* Juss. This was supported by Markgraf (1979) who mentioned "adult fruits of *O. borbonica* – the type species of *Ochrosia* Juss. – contain these holes, though only in the lower half or third". However, Pichon treated the whole complex as one genus, and subdivided it into three sections: *Ochrosia* section *Lactaria* F. Muell., *Ochrosia* section *Echinocaryon* F. Muell., and *Ochrosia* section *Phragmochrosia* Pichon. Section *Phragmochrosia* was proposed based on a single species – *Ochrosia apoensis*, and characterized by having both numerous fibres and rudimentary lateral cavities. Unfortunately, except for the fibrous endocarps I do not see the cavities mentioned by Pichon. Therefore, I prefer to reduce *Ochrosia* section *Phragmochrosia* and place it in *Ochrosia* section *Echinocaryon*.

Fosberg & Sachet (1977) agreed with Pichon who kept the cavity-fruited species as the true *Ochrosia* Juss., and thought that it was necessary to restrict the name *Ochrosia* Juss. to the portion containing the type (the cavity-fruited species) and tried to find a name for the other portion. They did not agree with Boiteau et al. (1974) who had proposed *Calpicarpum* G. Don emend. Boiteau for the species with

loosely fibrous endocarps, and instead resurrected the name *Neisosperma* Raf. Fosberg et al. (1977) placed *Bleekeria* Hassk., *Ochrosia* section *Lactaria* F. Muell., *Ochrosion* St.-Lag. (nomen nudum), and *Excavatia* Markgr. in synonymy of *Ochrosia* Juss., and *Lactaria* Rumph. ex Raf., *Pseudochrosia* Blume, *Ochrosia* section *Echinocaryon* F. Muell. and *Calpicarpum* G. Don emend. Boiteau as synonyms of *Neisosperma* Raf. This application was then followed by Markgraf (1979), Boiteau & Allorge (1981), and Forster (1993) who used *Neisosperma* Raf. for the fibrous-fruited species and *Ochrosia* Juss. for the cavity-fruited species.

In contrast Leeuwenberg (1987) put cavity-fruited and fibrous-fruited species together into one genus, reducing *Calpicarpum* G. Don emend. Boiteau, *Neisosperma* Raf., *Lactaria* Rumph. ex Raf., *Pseudochrosia* Blume, *Bleekeria* Hassk., and *Excavatia* Markgr. to the synonymy of *Ochrosia* Juss.

Ochrosia–*Neisosperma*

In proposing the segregation of *Neisosperma* from *Ochrosia*, Fosberg & Sachet (1972, 1974) justified recognition of the 2 genera based on differences in fruit (which is discussed above) and inflorescence characters (in those two publications they incorrectly spelled the genus as *Neiosperma*). However, as the inflorescences of very few species were studied in detail (the concept of the *Neisosperma* inflorescence was largely based on the study of living material of *N. oppositifolia* (Lam.) Fosberg & Sachet (= *Ochrosia oppositifolia* (Lam.) K. Schum.), they were also not certain that the characters given to separate the two genera would hold up to further investigation.

In my opinion, despite the diversity in fruit type the species are all very similar in flower and vegetative characters. Other clear characters are more useful for delimiting species rather than genera or sections. On the other hand the fruit difference is so clear and occurs so constantly that it should not be ignored. For that reason I prefer to treat them as sections under the genus *Ochrosia* Juss. until further evidence from a more comprehensive study is obtained and the relationship between these 2 sections becomes clearer.

Here, I apply the names *Ochrosia* section *Echinocaryon* F. Muell. (the oldest name at section level for the fibrous-fruited species) and *Ochrosia* section *Ochrosia* for the fibrous-fruited species and cavity-fruited species of *Ochrosia*, respectively, and reduce *Neisosperma* into *Ochrosia* section *Echinocaryon* F. Muell.

The name *Ochrosia* section *Lactaria* used by Mueller (1871), Valetton (1895) (as subgenus) and Pichon (1947) for the cavity-fruited species cannot be applied since it does not comply with the provisions of Article 22 of the International Code of Botanical Nomenclature (Greuter et al., 2000), and *Ochrosia* section *Ochrosia* is the valid name.

Malesian Ochrosia

Ochrosia species are widespread in mostly coastal areas and lowland forests in Africa, South Asia, Indochina, Malesia, northern Australia, and the Pacific Islands. In Malesia, there are 13 species, including *O. syncarpa* Markgr. (the only species with syncarpous fruit), and *O. ackeringae* (Teijsm. & Binn.) Miq. (the only species with hemisyncarpous fruit).

Ochrosia oppositifolia (Lam.) K. Schum. is the species with the widest distribution, found from the Seychelles in the west, through the Maldives Islands, Andaman,

Sri Lanka, Vietnam, Thailand, Malesia, and the Pacific Islands. Some others, such as *O. acuminata* Trimen ex Valetton, *O. apoensis* Elmer, *O. minima* (Markgr.) Fosberg & Boiteau, *O. syncarpa* Markgr. and *O. tenimberensis* Markgr., are known only from restricted areas.

MATERIAL AND METHODS

Herbarium material was studied from the following herbaria: A, BM, BO, CANB, GH, K, L, M, NSW, P, UC, WAG, and WRSL.

The dimensions given in the descriptions are for dried material except for the gynoecium and androecium characters which are for flowers rehydrated with water.

OCHROSIA Juss.

Ochrosia Juss. (1789) 144; A.DC. (1844) 356; Seem. (1865) 158; F. Muell. (1871) 130; Valetton (1895) 225; Markgr. (1927) 189; Pichon (1947) 205, 206; Leeuwenb. (1987) 47. — *Ochrosia* Juss. sect. *Ochrosia*. — *Ochrosia* Juss. sect. *Lactaria* F. Muell. (1871) 130; Pichon (1947) 206. — *Ochrosia* Juss. subgen. *Lactaria* (F. Muell.) Valetton (1895) 225. — *Ochrosia* sensu Fosberg & Sachet (1972) 47; Fosberg & Sachet (1974) 254; Fosberg, Boiteau & Sachet (1977) 23; Markgr. (1979) 233; Boiteau & L. Allorge (1981) 47. — Type: *Ochrosia maculata* Jacq. (= *Ochrosia borbonica* J.F. Gmel., nom. nud.).

Neiosperma Raf. (1838) 162; Fosberg & Sachet (1972) 48 (as '*Neiosperma*'); (1974) 254, 255 (as '*Neiosperma*'); Fosberg, Boiteau & Sachet (1977) 28; Markgr. (1979) 241; Boiteau & L. Allorge (1981) 64; P.I. Forst. (1993) 14; M.E. Endress & Bruyns (2000) 34. — Lectotype: *Neiosperma muricata* Raf. (= *N. oppositifolia* (Lam.) Fosberg & Sachet = *Ochrosia oppositifolia* (Lam.) K. Schum.), designated by Markgraf, 1979.

Lactaria Rumph. ex Raf. (1838) 162, nom. illeg.; Koidz. (1923) 48 (excl. *L. borbonica* J.F. Gmel. = *Ochrosia borbonica* J.F. Gmel.). — Type: *Lactaria salubris* Rumph. ex Raf. (= *Ochrosia oppositifolia* (Lam.) K. Schum.).

Pseudochrosia Blume (1850) 158; K. Schum. (1895) 156. — Type: *Pseudochrosia glomerata* Blume (= *Ochrosia glomerata* (Blume) F. Muell.).

Bleekeria Hassk. emend. Koidz. (1923) 51. — Type: *Bleekeria kalokarpa* Hassk. (= *Ochrosia elliptica* Labill.).

Excavatia Markgr. (1927) 194; (1936) 127. — Lectotype: *Excavatia littoralis* (Merr.) Markgr. (= *Ochrosia ackeringae* (Teijsm. & Binn.) Miq.), designated by Leeuwenberg, 1987.

Calpicarpum G. Don emend. Boiteau in Boiteau et al. (1974) 495, nom. illeg.; Boiteau, L. Allorge & Sevenet (1975) 152. — Lectotype: *Calpicarpum roxburghii* G. Don (= *Kopsia fruticosa* (Roxb.) A.DC.), designated by De Candolle, 1844.

Ochrosia sect. *Echinocaryon* F. Muell. (1871) 130; Pichon (1947) 209. — *Ochrosia* subg. *Echinocaryon* Valetton (1895) 225. — Type species: *Ochrosia kilneri* F. Muell.

Ochrosia sect. *Phragmochrosia* Pichon (1947) 211. — Type: *Ochrosia apoensis* Elmer.

Trees or shrubs with white latex. *Branchlets* terete, subangular or angular, glabrous, not lenticellate. *Leaves* 2–4(–6)-whorled, papery to coriaceous when dried, glabrous, petiolate; blades obovate, elliptic, or narrowly so, midrib prominent on abaxial side, impressed on adaxial side, glabrous; secondary veins usually rather straight, rarely strongly arcuate ascending, not reaching the margin, usually joining and forming a submarginal vein, rarely not joining. *Inflorescences* terminal and axillary cymes, in whorls or solitary, loose or congested, few- to many-flowered, glabrous, often with bracts, pedunculate; peduncle varying considerably in length, sometimes winged (in Malesia in 2 species only). *Flowers* sometimes fragrant, small, pedicellate; pedicel sepal-like,

bracteolate. *Sepals* ovate, or suborbicular to orbicular, margin entire or ciliolate, apex rounded or acute, without colleters inside, connate at base. *Corolla* salverform, white, greenish white, creamy white, or yellowish white, villose inside, glabrous outside; lobes elliptic, obovate, narrowly elliptic, or narrowly ovate, overlapping to the right, glabrous. *Stamens* included, free from each other; cells parallel, dehiscent throughout by longitudinal slits; filaments filiform, short. *Ovary* of 2 carpels (which are usually distinctly separated), gradually or abruptly narrowed at apex towards base of style, glabrous; disc entire, small; style filiform, split or not at base. *Fruits* usually apocarpous, rarely hemisyncarpous or syncarpous, drupaceous, smooth or remotely verrucose to verrucose, or with fine irregular ridges when dried, green and turning yellow, orange, red, or purple when ripe; mericarps ellipsoid, obovoid, ovoid, or subglobose, rarely (not in Malesian species) discoid or boat-shape, round in transverse section, or dorsoventrally compressed, sometimes with lateral and/or apical ridges, or with lateral and/or apical wing (not in Malesian species); endocarps split into diverging fibres, or consisting of thick and massive tissue, surrounding 2 lateral cavities. *Seeds* 1–3 on each placenta, flat, suborbicular or elliptic, with a wing-like structure along the margin, glabrous.

Distribution — About 40 species, of which 13 in Malesia. The majority of species are in the Pacific Islands. Spread from the Mascarene and Seychelles in the west throughout South Asia, Indochina, Malesia, northern Australia, and Pacific Islands as far east as the Marquesas and Hawaiian Islands.

KEY TO THE SECTIONS

- 1a. Fruits apocarpous; mericarps verrucose to smooth, or with fine irregular ridges when dried, more or less round in transverse section, not compressed; endocarps split into diverging fibres, lateral cavities absent. . **Ochrosia** sect. **Echinocaryon**
- b. Fruits apocarpous, rarely hemisyncarpous, or syncarpous; mericarps often smooth when dried, often dorsoventrally compressed or biconvex in transverse section; endocarps not split into diverging fibres, hard, thick, massive, surrounding 2 lateral cavities. **Ochrosia** sect. **Ochrosia**

KEY TO THE MALESIAN SPECIES

Based on flowering and fruiting material

- 1a. Secondary veins arcuate ascending, not more than 20 pairs, not joining, not forming a submarginal vein 2
- b. Secondary veins straight to rather arcuate ascending, 10 to more than 40 pairs, joining, forming a submarginal vein 3
- 2a. Leaves 2–4-whorled, blades papyraceous. Inflorescence 4–9 cm long. Sepals ovate; stamens inserted at 0.7–0.8 of the length of the corolla tube **4. O. ficifolia**
- b. Leaves 4–6(–7)-whorled, blades coriaceous. Inflorescence 9.5–18.5 cm long. Sepals suborbicular to orbicular. Stamens inserted at 0.2 of the length of the corolla tube **13. O. basistamina**
- 3a. Leaf blades width 1–1.7 cm, ratio 4.2–7.1. Fruits apocarpous or hemisyncarpous 4
- b. Leaf blades width 2.1–18 cm, ratio 1–5.8. Fruit syncarpous . . . **11. O. syncarpa**

- 4a. Leaf blades papyraceous when dried. Peduncle winged 5
 b. Leaf blades coriaceous or papyraceous when dried. Peduncle not winged (unknown in *O. tenimberensis*) 6
- 5a. Leaf apex acute or acuminate; peduncle 3.5–6 cm long; corolla tube 3.9–4 mm long; mericarps less than 1.5 cm long **10. O. minima**
 b. Leaf apex cuspidate; peduncle 0.6–3.3 cm long; corolla tube 13 mm long; mericarps up to 4.6 cm long **9. O. coccinea**
- 6a. Calyx not ciliolate at margin (unknown in *O. tenimberensis* and *O. sciadophylla*). Fruits apocarpous 7
 b. Calyx ciliolate at margin. Fruits hemisyncarpous **8. O. ackeringae**
- 7a. Mericarps verrucose to remotely so, or with fine irregular ridges when dried, endocarps loosely fibrous, lateral cavities absent 8
 b. Mericarps smooth when dried, endocarps massive, hard, surrounding 2 lateral cavities **12. O. tenimberensis**
- 8a. Secondary veins infrequently anastomosing around the submarginal vein, submarginal veins not angled, close to the margin. Fibres of the endocarps rather slender and thin (except for *O. oppositifolia*, which are slender and thin or hard and thick). Seeds 1 or 2 at either placenta 9
 b. Secondary veins frequently anastomosing around the submarginal vein, submarginal vein angled, 0.3–1 cm inside from the margin. Fibres of the endocarps hard and thick. Seeds 3 at either placenta **3. O. citrodora**
- 9a. Secondary veins less than 17 pairs. Mericarps 2.8–4.7 cm long 10
 b. Secondary veins 20 to more than 40 pairs. Mericarps 4.1–8.5 cm long 11
- 10a. Leaf apex acute to abruptly acuminate, or sometimes rounded. Peduncle 1–3 cm long. Corolla tube 6 mm long; sepals ovate, apex rounded, thick. Mericarps apiculate at apex **1. O. acuminata**
 b. Leaf apex gradually acuminate to cuspidate. Peduncle 0.2–1 cm long; corolla tube 7.5–8 mm long; sepals orbicular, apex obtuse, thin. Mericarps acuminate at apex **2. O. apoensis**
- 11a. Secondary veins straight to rather arcuate ascending near the margin, 21 to more than 40 pairs. Flowers more than 30 in each inflorescence. Seeds 1 or 2 at either placenta 12
 b. Secondary veins arcuate ascending, 20–22 pairs. Flowers 10–12 in each inflorescence. Seeds 1 at either placenta **7. O. sciadophylla**
- 12a. Leaf blades ratio 2.1–5.8, secondary veins 0.1–0.7 cm spaced. Corolla tube 3 mm long. Stamens inserted at 1 mm below the mouth. Seeds always 2 at either placenta **5. O. glomerata**
 b. Leaf blades ratio 1–3, secondary veins 0.2–1.5 cm spaced. Corolla tube 5.3–7 mm long. Stamens inserted at 2–2.5 mm below the mouth. Seeds often 1 at either placenta (or rarely with a small second one) **6. O. oppositifolia**

OCHROSIA section ECHINOCARYON

Ochrosia sect. *Echinocaryon* F. Muell. (1871) 130; Pichon (1947) 209. — *Ochrosia* subg. *Echinocaryon* Valetton (1895) 225. — Type: *Ochrosia kilneri* F. Muell.
Neiosperma Raf. (1838) 162; Fosberg & Sachet (1972) 48 (as '*Neiosperma*'); (1974) 254, 255 (as '*Neiosperma*'); Fosberg, Boiteau & Sachet (1977) 28; Markgr. (1979) 241; Boiteau & L. Allorge

- (1981) 64; P.I. Forst. (1993) 14; M.E. Endress & Bruyns (2000) 34. — Lectotype: *Neisosperma muricata* Raf. (= *N. oppositifolia* (Lam.) Fosberg & Sachet = *Ochrosia oppositifolia* (Lam.) K. Schum.), designated by Markgraf, 1979.
- Lactaria* Rumph. ex Raf. (1838) 162, nom. illeg.; Koidz. (1923) 48 (excl. *L. borbonica* J.F. Gmel. = *Ochrosia borbonica* J.F. Gmel.). — Type: *Lactaria salubris* Rumph. ex Raf. (= *Ochrosia oppositifolia* (Lam.) K. Schum.).
- Pseudochrosia* Blume (1850) 158; K. Schum. (1895) 156. — Type: *Pseudochrosia glomerata* Blume (= *Ochrosia glomerata* (Blume) F. Muell.).
- Ochrosia* sensu Markgr. (1927) 189.
- Ochrosia* sect. *Phragmochrosia* Pichon (1947) 211. — Type: *Ochrosia apoensis* Elmer.
- Calpicarpum* G. Don emend. Boiteau in Boiteau et al. (1974) 495, nom. illeg.; Boiteau, L. Allorge & Sevenet (1975) 152. — Lectotype: *Calpicarpum oppositifolium* (Lam.) Boiteau, designated by Boiteau in Boiteau et al., 1974. See note below.

Fruits apocarpous. *Mericarps* verrucose to remotely so, or with fine irregular ridges when dried, more or less round in transverse section, not compressed. *Endocarps* split into diverging fibres, lateral cavities absent.

Note — Alphonse de Candolle (1844) reduced *Calpicarpum* G. Don to *Kopsia* Blume, and excluded *C. lamarckii* G. Don (= *Cerbera oppositifolia* Lam. = *Ochrosia oppositifolia* (Lam.) K. Schum.). It was supported by Fosberg & Sachet (1977), who showed clearly that the description in the protologue of *Calpicarpum* G. Don almost entirely applies to *Kopsia*. However, Boiteau et al. (1974, 1975) ignored it and applied this name (*Calpicarpum*) to the component they were segregating from *Ochrosia*, exemplified by the plant excluded by De Candolle. Boiteau in Boiteau et al. (1974) designated *Calpicarpum oppositifolium* (Lam.) Boiteau as the type species for his *Calpicarpum*.

KEY TO THE MALESIAN SPECIES OF OCHROSIA SECTION ECHINOCARYON

- 1a. Style split at the base. *Mericarps* acute to acuminate at apex, fibres hard and thick, forming hard thick pointed ends. Seeds 3 at either placenta 2
- b. Style not split at the base (unknown in *O. sciadophylla*). *Mericarps* acuminate to apiculate at apex, fibres rather soft and slender, not forming hard thick pointed ends (except *O. oppositifolia*, which are slender and thin or hard and thick). Seeds 1 or 2 at either placenta 3
- 2a. Secondary veins strongly arcuate ascending, less than 15 pairs, not joining, submarginal vein absent. Style 7–9 mm long. *Mericarps* narrowly ellipsoid or narrowly obovoid **4. *O. ficifolia***
- b. Secondary veins straight, 15–32 pairs, joining, submarginal vein present. Style 3–5.1 mm long. *Mericarps* ellipsoid **3. *O. citrodora***
- 3a. Secondary veins 10–16 pairs. Ovary gradually narrowed at apex towards base of style. *Mericarps* with lateral ridges 4
- b. Secondary veins 20 to more than 40 pairs. Ovary rounded at apex and abruptly narrowed at base of style (unknown in *O. sciadophylla*). *Mericarps* without lateral ridges 5
- 4a. Leaf blades acute to abruptly acuminate at apex, sometimes rounded. Peduncle 1–3 cm long. Sepals ovate, apex rounded, thick. Corolla tube 6 mm long, tube-lobes ratio 0.9. *Mericarps* apiculate at apex, acumen 0.4–1 cm long . **1. *O. acuminata***

- b. Leaf blades gradually acuminate to cuspidate at apex. Peduncle 0.2–1 cm long. Corolla tube 7.5–8 mm long, tube-lobes ratio 1.3–1.5. Sepals suborbicular to orbicular, apex obtuse, thin. Mericarps acuminate at apex, acumen less than 0.5 cm long **2. *O. apoensis***
- 5a. Secondary veins straight to rather arcuate ascending near the margin, 21 to more than 40 pairs. Flowers more than 30 on each inflorescence 6
- b. Secondary veins arcuate ascending, 20–22 pairs. Flowers 10–12 on each inflorescence **7. *O. sciadophylla***
- 6a. Corolla tube 3 mm long; stamens inserted at 1 mm below the mouth. Mericarps verrucose when dried; seeds always 2 at either placenta **5. *O. glomerata***
- b. Corolla tube 5.3–7 mm long; stamens inserted at 2–2.5 mm below the mouth. Mericarps remotely verrucose when dried; seeds often 1 at either placenta (or rarely with a small second one) **6. *O. oppositifolia***

1. *Ochrosia acuminata* Trimen ex Valeton

Ochrosia acuminata Trimen ex Valeton (1895) 231, pl. xxii; Pichon (1947) 209. — *Neisosperma acuminata* (Trimen ex Valeton) Fosberg & Sachet (1977) 28. — *Neisosperma acuminata* (Trimen ex Valeton) Fosberg & Sachet var. *acuminata*; Markgr. (1979) 244. — *Lactaria acuminata* (Trimen ex Valeton) Koidz. (1923) 51. — Type: *Teijsmann s.n.* (holo n.v.; iso L), Indonesia, Sulawesi, North Sulawesi, Manado.

Tree, (8–)15–30 m high. *Branchlets* subangular to angular, 3–5 mm diam., smooth, not lenticellate, glabrous, sometimes with conspicuous leaf scars. *Leaves* 3- or 4-whorled, coriaceous when dried, petiolate; petiole 1–2 cm long, glabrous; blades usually obovate, rarely narrowly so, 5.7–16(–23) by 2.7–6.6 cm, ratio 1.7–2.9(–3.3), base cuneate, margin entire to undulate, apex acute or abruptly acuminate, sometimes rounded; secondary veins conspicuous, usually prominent, 10–14 pairs, 0.5–2 cm spaced, at an angle of 45–60° to the midrib, straight to strongly arcuate ascending, not reaching the margin, joining, forming a submarginal vein which is 1–2 mm inside from the margin, often branched before reaching the submarginal vein; submarginal vein sometimes inconspicuous; tertiary veins not prominent, rarely conspicuous. *Inflorescence* 2.2–6 cm long, axillary cymes, in whorls of 2 or 3, loose, glabrous, with bracts, pedunculate; peduncle 1–3 cm long, glabrous, thick. *Flowers* 10–15(–25) on each inflorescence; pedicels 2.5 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1 by 1 mm, margin entire, apex acute, thin, glabrous on both sides, 2 or 3 on each pedicel. *Sepals* ovate, 1.7–2 by 1.4–2 mm, ratio 1–1.2, margin entire, apex rounded, glabrous on both sides, thick, spreading outwards, connate at base for 0.5 mm. *Corolla* greenish cream or pale yellow, in mature buds narrowly ellipsoid, 9–10 by 2 mm, ratio 4.5–5, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 1.5 mm wide just below the insertion of stamens; tube cylindrical, 6 mm long, straight, widening at the stamens insertion, and there 2 mm wide, tube-calyx ratio 3–3.5, tube-lobes ratio 0.9; lobes elliptic, 6.5 by 3 mm, ratio 2.2, margin entire, apex obtuse, glabrous, auriculate on the left side at base. *Stamens* inserted at 3 mm below the mouth, at 0.5 of the length of the corolla tube; filaments filiform, 0.8 mm long; anthers ovate, 1.3 by 0.6 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 4.7 mm long; ovary ovoid, widening at base, gradually narrowed at apex towards base of style, 0.9 by 0.8 mm, of 2 distinctly separated carpels; style filiform,

3 mm long, style-ovary ratio 3.3, not split at base; pistil head conical, 0.8 by 0.3 mm. *Fruits* composed of 2 separate mericarps; mericarps blackish brown when dried, ellipsoid, 2.9–4.7 by 1.5–2.5 by 1.5–2.5 cm, base rounded, apex gradually apiculate, acumen 0.4–1 cm long, straight or rather curled, with distinct lateral ridges, remotely verrucose or with fine irregular ridges when dried, glabrous, rather glossy, indehiscent; endocarps split into fibres penetrating the mesocarps; fibres rather thin and slender, not forming hard thick pointed ends. *Seeds* 1 at either placenta, flat, ellipsoid, 1–3 by 0.8–1.7 cm, apex acute, glabrous.

Distribution — Malesia: Indonesia (Sulawesi).

Habitat & Ecology — Found in disturbed primary forests, open secondary forests, or open areas such as roadsides. On clayey or sandy soil. Altitude 0–1500 m.

Notes — 1. Holotype specimen is not found. It was probably in BO.

2. This species is characterized by the long acumen on the fruits.

3. Markgraf (1979) included two varieties in this species, namely *Neisosperma acuminata* var. *acuminata* and *N. acuminata* var. *apoense*. Var. *apoense* is here treated as a separate species.

2. *Ochrosia apoensis* Elmer

Ochrosia apoensis Elmer (1912) 1461; Merr. (1923) 329; Pichon (1947) 211. — *Neisosperma apoensis* (Elmer) Fosberg & Sachet (1977) 28. — *Neisosperma acuminata* (Trimen ex Valetton) Fosberg & Sachet var. *apoense* (Elmer) Markgr. (1979) 244. — Type: *Elmer 10478* (holo PNH[†]; lecto L, designated here; iso A), Philippines, Mindanao, Davao, Todaya-Mt Apo.

Tree, 10–21 m high. *Branchlets* terete, subangular to angular, 3–5 mm diam., smooth, not lenticellate, glabrous, sometimes with conspicuous leaf scars. *Leaves* 3- or 4-whorled, coriaceous when dried, petiolate; petiole 1–2.5 cm long, glabrous; blades (narrowly) obovate, 7–14 by 2.2–4.2 cm, ratio 2.7–4.7, base cuneate, margin entire to undulate, apex gradually acuminate to cuspidate; secondary veins conspicuous on both sides, rather prominent on abaxial side, 13–16 pairs, 0.3–1 cm spaced, at an angle of 70–85° to the midrib, straight to rather arcuate ascending near the margin, not reaching the margin, joining, forming a submarginal vein which is 1–2 mm inside from the margin; tertiary veins not prominent, conspicuous on abaxial side only, reticulate. *Inflorescence* 1.5–3.5 cm long, axillary cymes, in whorls of 2 or 3, loose, glabrous, bracteolate, shortly pedunculate; peduncle 0.2–1 cm long, glabrous. *Flowers* 7–10 in each inflorescence; pedicels 2 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1–1.1 by 1–1.7 mm, margin entire, apex acute, thin, glabrous on both sides, 3 or 4 on each pedicel. *Sepals* suborbicular to orbicular, 1.8–2 by 2–2.7 mm, ratio 0.7–1, margin entire, apex obtuse, glabrous on both sides, thin, rather transparent, not spreading outwards, connate at base for 0.6 mm. *Corolla* white, in mature buds narrowly ellipsoid, 14 by 2 mm, ratio 7, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 1.5 mm wide just below the insertion of stamens; tube cylindrical, 7.5–8 mm long, straight, widening at the stamens insertion, and there 2 mm wide, tubes-calyx ratio 4–4.2, tubes-lobes ratio 1.3–1.5; lobes elliptic, 5–6 by 3 mm, ratio 1.7–2, margin entire, apex obtuse, glabrous, thin, auriculate on the left side at base. *Stamens* inserted at 3.5 mm below the mouth, 0.5 of the length of the corolla tube; filaments filiform, 0.5 mm long; anthers ovate, 1.5 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 5 mm long; ovary ovoid,

widening at base, gradually narrowed at apex towards base of style, 1 by 0.8 mm, of 2 distinctly separated carpels; style filiform, 3.4 mm long, style-ovary ratio 3.4, not split at base; pistil head conical, 0.4–0.5 by 0.3 mm. *Fruits* composed of 2 separate mericarps; mericarps blackish when dried, ellipsoid, 2.8–3.6 by 1.4–2 by 1.4–2 cm, base rounded, apex acuminate, acumen short, less than 0.5 cm long, straight or rather curled, with distinct lateral ridges, remotely verrucose or with fine irregular ridges when dried, rather glossy, glabrous, indehiscent; endocarps split into fibres penetrating the mesocarps; fibres rather thin and slender, not forming hard thick pointed ends. *Seeds* 1 at either placenta, flat, ellipsoid, 1–2.2 by 0.8–1 cm, apex acute, glabrous.

Distribution — Malesia: Philippines (Luzon, Mindanao)

Habitat & Ecology — Forest slopes. Altitude 810–970 m.

Notes — 1. Markgraf (1979) included this species as a variety of *Neisosperma acuminata* (Trimen ex Valetton) Fosberg & Sachet (= *O. acuminata* Trimen ex Valetton). However, I agree with Elmer (1912) who mentioned that this species resembles *O. acuminata* but is sufficiently distinct to deserve specific status. The key to the species gives the differences between the two. The clearest one is a sepal character (sepals ovate and thick vs. orbicular and thin).

2. In general, the leaf blades are narrower than those of *O. acuminata*.

3. *Ochrosia citrodora* Lauterb. & K. Schum.

Ochrosia citrodora Lauterb. & K. Schum. in K. Schum. & Lauterb. (1901) 504; Markgr. (1927) 190; Pichon (1947) 211 (as '*O. citrodora*'). — *Neisosperma citrodora* (Lauterb. & K. Schum.) Fosberg & Sachet (1977) 29; Markgr. (1979) 245. — Type: *Lauterbach 1073* (holo B⁺; lecto WRS), designated by Markgraf, (1979), Papua New Guinea, Madang, Gogol.

Paralstonia clusiacea auct. non Baill.: Markgr. (1926) 283. — The specimen mentioned (*Gjellerup 116*) is clearly *O. citrodora*.

Shrub or tree, 2–25 m high. *Branchlets* angular to subangular, 3–6 mm diam., not lenticellate, smooth, glabrous, with conspicuous leaf scars. *Leaves* 2- or 3-whorled, coriaceous or papyraceous when dried, petiolate; petiole 0.7–3.5 cm long, glabrous; blades (narrowly) obovate or (narrowly) elliptic, 9.5–29.5 by 3.1–8.3 cm, ratio 1.9–3.8, base cuneate, margin entire, rarely undulate, apex acuminate or cuspidate; secondary veins usually inconspicuous, not prominent, 15–32 pairs, 0.2–0.7 cm spaced, at an angle of 80–90° to the midrib, straight to rather arcuate ascending near the margin, not reaching the margin, joining, forming a submarginal vein, much anastomosing around the submarginal vein; submarginal vein usually angled, 0.3–1 cm inside from the margin; tertiary veins not prominent, conspicuous, distinctly reticulate especially around submarginal vein. *Inflorescence* 4–10.5 cm long, terminal and axillary cymes, in whorls of 2 or 3, loose, glabrous, sometimes with bracts, pedunculate; peduncle 2.5–8 cm long, glabrous, often slender. *Flowers* 5–17(–30) in each inflorescence, fairly long pedicellate; pedicels 3.5–5 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1–1.3 by 1–1.1 mm, margin entire, apex rounded, rough outside, smooth inside, glabrous, 2–7 on each pedicel. *Sepals* ovate, 2.1–3.2 by 1.8–2.2 mm, ratio 1.1–1.8, margin entire, apex rounded, thick except along the margin, glabrous on both sides, rough outside, smooth inside, connate at base for 1 mm. *Corolla* white, creamy white, yellowish white, or greenish white, in mature buds narrowly ellipsoid, 13–18 by 3 mm, ratio 4.3–6, of which the lobes form a rounded apex, glabrous outside, villose inside,

rather dense, forming a belt of 1.5–2 mm wide just below the insertion of stamens; tube cylindrical, 11–12 mm long, straight, widening at the stamens insertion, and there 2–2.3 mm wide, tube-calyx ratio 3.4–5.2, tube-lobes ratio 0.9–1.2; lobes narrowly elliptic, 9–14 by 3 mm, ratio 3–4.7, margin entire, apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 3.5–4 mm from the mouth, 0.6–0.7 of the length of the corolla tube; filaments filiform, 0.5 mm long; anthers ovate to narrowly so, 2 by 0.5–0.8 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 4.3–7.1 mm long; ovary subglobose, 1 by 1 mm, of 2 distinctly separated carpels, widening at base, apex rounded and abruptly narrowed at base of style; style filiform, 3–5.1 mm long, style-ovary ratio 2.4–5.1, split at base; pistil head ovoid, 0.8–0.9 mm long. *Fruits* composed of 2 separate mericarps; mericarps brown or reddish brown when dried, ellipsoid, 5.4–9.6 by 1.8–3.8 by 1.3–3.2 cm, base cuneate or rounded, apex acute, remotely verrucose when dried, glabrous, indehiscent, green and turning yellow, orange, or purplish red when ripe; endocarps split into fibres penetrating the mesocarps; fibres hard and thick, usually forming hard thick pointed ends. *Seeds* 3 at either placenta, flat, suborbicular to ellipsoid, unequal in size, the first two 0.8–3.1 by 0.7–2.5, the second one 0.6–1.3 by 0.4–1.2 cm, apex acuminate, glabrous, whitish brown.

Distribution — Malesia: Indonesia (West Papua), Papua New Guinea.

Habitat & Ecology — In primary and secondary lowland rain forests, gully forests, riversides, or swampy areas. On clay, stony soil, or copper-rich soil. Altitude 0–850 m.

Note — Characterized by its secondary veins, which are frequently anastomosing around the submarginal vein, and its angled submarginal vein, which is situated 3–10 mm inside from the margin.

4. *Ochrosia ficifolia* (S. Moore) Markgr.

Ochrosia ficifolia (S. Moore) Markgr. (1927) 190; Pichon (1947) 211. — *Alstonia ficifolia* S. Moore (1923) 32. — *Neisosperma ficifolia* (S. Moore) Fosberg & Sachet in Fosberg, Boiteau & Sachet (1977) 29; Markgr. (1979) 244. — Type: *Forbes 74* (holo BM; iso L), Papua New Guinea, Central, Sogeri.

Ochrosia rudis Markgr. (1927) 189; Pichon (1947) 211. — *Neisosperma rudis* (Markgr.) Fosberg & Sachet in Fosberg, Boiteau & Sachet (1977) 31. — Type: *Beccari 715* (holo FI; photo in L), Papua New Guinea, Andai.

Shrub or tree, 3–30 m high. *Branchlets* angular to subangular, thick, 4.5–7 mm diam., sulcate when dried, not lenticellate, smooth, glabrous. *Leaves* 2–4-whorled, papyraceous when dried, sometimes thickly so; petiole 1–4 cm long, glabrous; blades (narrowly) obovate, 10.5–26 by 4.6–10 cm, ratio 1.9–3.9, base cuneate to long cuneate, margin entire, apex acuminate to cuspidate, rarely acute; secondary veins conspicuous, slightly prominent on abaxial side, 7–12 pairs, 0.8–3.1 cm spaced, at an angle of c. 90° to the midrib, strongly arcuate ascending, not reaching the margin, not joining, not forming a submarginal vein; tertiary veins indistinct. *Inflorescence* 4–9 cm long, axillary cymes, in whorls of 2, not much branched, congested, glabrous, sometimes with bracts, pedunculate; peduncle 3–7 cm long, thick, glabrous. *Flowers* 20–25 on each inflorescence, pedicellate; pedicels 1–4 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1–1.3 by 0.7–1.3 mm, margin entire, apex rounded, rough outside, smooth inside, glabrous, 2 or 3 on each pedicel. *Sepals* ovate, 2.2–3 by 1.4–1.9 mm,

ratio 1.4–1.6, margin entire, apex rounded, thick except along the margin, glabrous on both sides, rough outside, smooth inside, connate at base for 1 mm. *Corolla* white, cream, yellow, in mature buds narrowly ellipsoid, 13–16 by 3 mm, ratio 4.3–5.3, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 2–2.5 mm wide just below the insertion of stamens; tube cylindrical, 11–14.3 mm long straight, widening at the stamens insertion, and there 2–2.5 mm wide, tube-calyx ratio 4.8–5.1, tube-lobes ratio 0.8–0.9; lobes narrowly elliptic, 13–16 by 4–5 mm, ratio 3.2–4, margin entire, apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 3.5–4 mm below the mouth, 0.7–0.8 of the length of the corolla tube; filaments filiform, 0.3 mm long; anthers ovate to narrowly so, 1.5–1.6 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 8.8–9 mm long; ovary subglobose, 0.9–1 by 0.9 mm, of 2 distinctly separated carpels, widening at base, apex rounded and abruptly narrowed at base of style; style filiform, 7–9 mm long, style-ovary ratio 7–9, split at base; pistil head ovoid, 0.8–0.9 mm long. *Fruits* composed of 2 separate mericarps; mericarps brown or blackish brown when dried, narrowly ellipsoid to narrowly obovoid, 7.2–11 by 2.6–3 by 2.5–2.7 cm, base rounded, apex acuminate, acumen short, remotely verrucose or with fine irregular ridges when dried, glabrous, indehiscent, green and turning purple, or bluish purple when ripe; endocarps split into fibres penetrating the mesocarps; fibres hard and thick, usually forming hard thick pointed ends. *Seeds* 3 at either placenta, flat, suborbicular to ellipsoid, apex acuminate, glabrous, brown, unequal in size, the first two 1.8–2.4 by 1.5–1.6 cm, the third 0.5–1.6 by 0.4–1.1 cm.

Distribution — Malesia: Indonesia (West Papua), Papua New Guinea.

Habitat & Ecology — Mostly in primary lowland forests. Also found in monsoon forests, swampy forests, floodplain forests or dry gullies on margin of seasonally arid grassland. On clayey, sandy, stony, or gravely clayey soil. Altitude 2–800(–2100) m.

Notes — 1. The species usually occurs in the lowland forests, but it also has been collected from montane forest in Yaibos, Western Highlands Province, Papua New Guinea, at an altitude of 2100 m.

2. This species is uniquely characterized by its few and strongly arcuate ascending secondary veins, that do not join to form a submarginal vein.

5. *Ochrosia glomerata* (Blume) F. Muell.

Ochrosia glomerata (Blume) F. Muell. (1871) 130; Valetton (1895) 233; Markgr. (1927) 191; Merr. & L.M. Perry (1943) 213; Pichon (1947) 209; H. St. John (1973) 280. — *Pseudochrosia glomerata* Blume (1850) 158; K. Schum. (1888) 214; (1895) 156. — *Neisosperma glomerata* (Blume) Fosberg & Sachet in Fosberg, Boiteau & Sachet (1977) 29; Markgr. (1979) 246. — *Lactaria glomerata* (Blume) Koidz. (1923) 51. — Type: *Zippelius s.n.* (holo L), Indonesia, Papua.

Tree, 4–30 m high. *Branchlets* angular to subangular, 3.5–6 mm diam., often sulcate when dried, not lenticellate, glabrous, smooth, with conspicuous leaf scars. *Leaves* (2- or) 3- or 4-whorled, coriaceous when dried, petiolate; petiole 0.6–5.3 cm long, glabrous; blades (narrowly) obovate or (narrowly) elliptic, 5.4–26 by 2.1–8 cm, ratio 2.1–5.8, base decurrent into petiole, margin entire to slightly undulate, apex usually acuminate, sometimes acute, or very rarely shallowly retuse, secondary veins conspicuous, slightly prominent on abaxial side, 28–45 pairs, 0.1–0.7 cm spaced, at an angle of 80–90° to the midrib, straight to rather arcuate ascending near the margin, not reaching the margin,

joining, forming a submarginal vein; tertiary veins often indistinct. *Inflorescence* 1.5–18 cm long, terminal and axillary cymes, in whorls of 2–4, sometimes solitary, congested, glabrous, sometimes with bracts, pedunculate; peduncle 1–8 cm long, glabrous, often thick. *Flowers* fragrant, more than 30 in each inflorescence, pedicellate; pedicels 2 mm long, glabrous, bracteolate; bracteoles sepal-like, relatively small, ovate, 0.6–0.8 by 0.6 mm, margin entire, apex rounded, rough outside, smooth inside, glabrous on both sides, 2 or 3 on each pedicel. *Sepals* ovate, unequal in size, 1.5–2 by 1.3–2 mm, ratio 1–1.1, margin entire, apex acute, thick except along the margin, glabrous on both sides, rough outside, smooth inside, connate at base for 0.4 mm. *Corolla* white, in mature buds narrowly ellipsoid, 9 by 2–3 mm, ratio 3–4.5, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 1.5 mm wide just below the mouth; tube cylindrical, 3 mm long, straight, widening at the stamens insertion, and there 2 mm wide, tube-calyx ratio 1.5–2, tube-lobes ratio 0.4; lobes narrowly elliptic, 8 by 2 mm, ratio 4, margin entire, apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 1 mm below the mouth, 0.7 of the length of the corolla tube; filaments filiform, 0.4 mm long; anthers ovate to narrowly so, 1.5–1.8 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 2.5 mm long; ovary subglobose, 1 by 1 mm, of 2 distinctly separated carpels, widening at base, apex rounded and abruptly narrowed at base of style; style filiform, 1 mm long, style-ovary ratio 1, not split at base; pistil head ovoid or conical, 0.5 by 0.2–0.3 mm. *Fruits* composed of 2 separate mericarps; mericarps blackish brown or brown when dried, ovoid, ellipsoid, or subglobose, 4.1–7.6 by 1.8–3.5 by 1.7–3.5 cm, base rounded to blunt, apex apiculate, acumen often strongly curled, verrucose when dried, glabrous, rather glossy, indehiscent, green and turning yellow or orange when ripe; endocarps split into fibres penetrating the mesocarps; fibres rather thin and slender, not forming hard thick pointed ends. *Seeds* 2 at either placenta, flat, suborbicular to ellipsoid, 1.3–3 by 1–2.1 cm, apex acuminate, glabrous, whitish.

Distribution — In Malesia: Malaysia (Borneo: Sabah), Philippines (Luzon, Palawan, Mindanao, Sibuyan, Mindoro, Negros) and Indonesia (North Sulawesi, Moluccas, West Papua). Also found in Solomon Islands.

Habitat & Ecology — In primary and secondary rain forests, closed broadleaved rain forests, riversides, beach forests, swampy areas, disturbed forests or open areas. Also found in forests dominated by *Dipterocarpus* species, dry forests with *Casuarina* species or open forests with rattans and climbing bamboos. On red lateritic clay over ultra basic rocks, clay loam, stony soil, or black soil. Altitude 2–900 m.

Note — This species is characterized by its short corolla tube and verrucose fruits (when dried), which make it most similar to *O. oppositifolia*. The shape and size of the leaf blades is very variable.

6. *Ochrosia oppositifolia* (Lam.) K. Schum.

Ochrosia oppositifolia (Lam.) K. Schum. (1895) 156; K. Schum. & Lauterb. (1901) 504; Merr. (1923) 330; Pichon (1947) 211; Guillaumin (1948) 293; Boiteau, L. Allorge & Sevenet (1972) 629; H. - Ochrosia borbonica* auct. non J.F. Gmel.: Trimen (1895) 129, pl. lx.
- Ochrosia parviflora* sensu Markgr. (1926) 283.

Tree, 2.5–45(–60) m high. *Branchlets* terete, often angular towards the upper part of the branchlets, hollow, thick, (4–)6–9 mm diam., often sulcate when dried, not lenticellate, glabrous, with conspicuous leaf scars. *Leaves* 3- or 4- (or 5-) whorled, coriaceous or papyraceous when dried, long petiolate; petiole 1.5–6.6 cm long, glabrous; blades usually obovate, very rarely elliptic, 6.5–36 by 3.4–18 cm, ratio 1–3, base decurrent into petiole, margin entire, apex often rounded or acuminate, sometimes retuse, shallowly retuse, or truncate; secondary veins conspicuous on both sides, not prominent, 21–42 pairs, 0.2–1.5 cm spaced, at an angle of 70–90° to the midrib, straight to rather arcuate ascending, not reaching the margin, joining, forming a distinct submarginal vein which is close to the margin; tertiary veins rather inconspicuous. *Inflorescence* 2–17 cm long, terminal and axillary cymes, in whorls of 2–4, congested, glabrous, sometimes with bracts, pedunculate; peduncle 1–10.5 cm long, glabrous. *Flowers* fragrant, more than 30 in each inflorescence, fairly long pedicellate; pedicels 2.1–4 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 0.8–1.3 by 0.6–1 mm, margin entire, apex rounded, rough outside, smooth inside, thick, glabrous on both sides, 2 or 3 on each pedicel. *Sepals* ovate, 2–2.3 by 1.8–2 mm, ratio 1–1.2, margin entire, apex rounded, thick except along the margin, glabrous on both sides, rough outside, smooth inside, connate at base for 1 mm. *Corolla* white, creamy white, or yellowish white, in mature buds narrowly ellipsoid, 11–15 by 2–2.5 mm, ratio 4.4–6, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 1.5–2 mm wide just below the insertion of stamens; tube cylindrical, 5.3–7 mm long, straight, widening at the stamens insertion, and there 2–2.3 mm wide, tube-calyx ratio 2.5–3.5, tube-lobes ratio 0.5–0.7; lobes narrowly elliptic, 9–12 by 3.5–4 mm, ratio 2.6–3, margin entire, apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 2–2.5 mm below the mouth, 0.5–0.7 of the length of the corolla tube; filaments filiform, 0.5–0.6 mm long; anthers ovate to narrowly so, 1.2–1.5 by 0.5–0.8 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 2.5–3.5 mm long; ovary subglobose, widening at base, apex rounded and abruptly narrowed at base of style, 1 by 1 mm, of 2 distinctly separated carpels; style filiform, 1–1.9 mm long, style-ovary ratio 1–1.9, thick, not split at base; pistil head ovoid or conical, 0.5–0.6 by 0.3 mm. *Fruits* composed of 2 separate mericarps; mericarps blackish brown or light brown when dried, ovoid to ellipsoid, sometimes subglobose, 5–8.5 by 3–5.1 by 2.8–4 cm, apex apiculate, acumen strongly curled, sometimes acuminate, remotely verrucose when dried, glabrous, indehiscent, green and turning yellow or orange when ripe; endocarps split into fibres penetrating the mesocarps; fibres hard and thick or rather thin

and slender, forming hard thick pointed ends or not. *Seeds* often 1 at either placenta, flat, suborbicular to ellipsoid, 2.6–3.8 by 1.9–2.9 cm, rarely with a small second one, flat, ellipsoid, 1–2.5 by 0.7–1.7 cm, apex acuminate, glabrous, brown.

Distribution — Sri Lanka, Andaman Islands, Thailand. In Malesia: Malaysia (Peninsular Malaysia, Borneo: Sabah, Sarawak), Philippines (Mindanao, Polilo, Luzon, Mindoro, Babuyanes), Indonesia (Sumatra, Java, South Sulawesi, Moluccas, West Papua), and Papua New Guinea. Widespread throughout Pacific Islands: Samoa, Marshall Islands, Fiji, Vanuatu, Mariana Islands, Solomon Islands, Tonga, Caroline Islands, New Caledonia, Seychelles Islands, Tahiti, and Austral Islands.

Habitat & Ecology — Rain forests by seashore, beach vegetation, disturbed primary forests on deep coral sand, edge of mangrove swamps, or open areas. On coral sand and gravel. Altitude 0–200 m.

Notes — 1. This species is characterized by its large leaf blades and short corolla tubes. The mericarps look like those of *O. glomerata*, but less (remotely) verrucose. They are also different in the number of seeds (often 1 or rarely with a second small one at either placenta in *O. oppositifolia* vs. always 2 in *O. glomerata*).

2. This is the most collected *Ochrosia* species.

3. Mostly found at very low altitudes, from 0 to less than 100 m asl. Only a few specimens have been collected from an altitude of 175–400 m (in Tinian Islands and Rota in Mariana Islands, and Malili in South Sulawesi).

4. The genus *Calpicarpum* G. Don was reduced to *Kopsia* Blume by Alphonse de Candolle in 1844 by excluding *C. lamarckii* G. Don (= *Cerbera oppositifolia* Lam. = *Ochrosia oppositifolia* (Lam.) K. Schum.). So the name *Kopsia lamarckii* is a misapplied name.

7. *Ochrosia sciadophylla* Markgr.

Ochrosia sciadophylla Markgr. (1967) 26. — *Neisosperma sciadophylla* (Markgr.) Fosberg & Sachet in Fosberg, Boiteau & Sachet (1977) 31; Markgr. (1979) 246. — Type: *Whitmore's collectors BSIP 3700* (holo BSIP n.v.; iso L), Solomon Islands, New Georgia Islands, Vaimbu.

Tree, 9–36 m high. *Branchlets* angular, 4–5 mm diam., sulcate when dried, not lenticellate, glabrous, smooth, leaf scars often conspicuous, blackish. *Leaves* 4-whorled, coriaceous or thinly so when dried; petiole 2–4.7 cm long, thin, glabrous; blades narrowly elliptic, 18.1–24 by 4.8–5.7 cm, ratio 3.2–4.5, base cuneate, margin entire or slightly undulate, apex usually acuminate, sometimes acute; secondary veins conspicuous, prominent on abaxial side, 20–22 pairs, 0.6–1.4 cm spaced, at an angle of 80–85° to the midrib, arcuate ascending, not reaching the margin, joining, forming a submarginal vein, which is close to the margin; tertiary veins not prominent, usually conspicuous only on abaxial side, reticulate. *Inflorescence* 3–6.5 cm long, terminal and axillary cymes, in whorls of 3 or 4, loose, glabrous, sometimes with bracts, pedunculate; peduncle 0.7–4.5 cm long, glabrous. *Flowers* fragrant, 10–12 in each inflorescence, pedicellate; pedicels 3 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1 by 1 mm, margin entire, apex acute, thick, rough outside, smooth inside, glabrous, 1 or 2 on each pedicel. *Corolla* white or sometimes yellowish white. *Fruits* composed of 2 separate mericarps; mericarps blackish brown when dried, ovoid, 4.9–6.5 by 2.5–3.4 by 2.3–3.1 cm, base rounded, apex usually apiculate, acumen 0.5–0.8 cm

long, usually strongly curled at the apical part, verrucose when dried, glabrous, smooth, rather glossy, indehiscent, green when unripe; endocarps split into fibres penetrating the mesocarps; fibres rather thin and slender, not forming hard thick pointed ends. *Seeds* 1 at either placenta, flat, ellipsoid, 2.9–3.4 by 1.5–1.8 cm, base rounded, apex cuspidate, glabrous, whitish brown.

Distribution — Malesia: Papua New Guinea. Mostly found in the Solomon Islands.

Habitat & Ecology — In primary and secondary lowland rain forests. On volcanic rock. Altitude 9–170 m.

Notes — 1. Specimens with mature buds and open flowers are not available.

2. The secondary veins are arcuate ascending like those of *O. ficifolia* but it has many-nerved leaves (which are less than 15 pairs in *O. ficifolia*), thin and slender fibres (which are thick and hard in *O. ficifolia*) and one seed at either placenta (which are 3 in *O. ficifolia*).

OCHROSIA section OCHROSIA

Ochrosia Juss. sect. *Ochrosia*. — *Ochrosia* Juss. sect. *Lactaria* F. Muell. (1871) 130; Pichon (1947) 206. — *Ochrosia* Juss. subg. *Lactaria* (F. Muell.) Valetton (1895) 225. — *Ochrosia* sensu Fosberg & Sachet (1972) 47; (1974) 254; Fosberg, Boiteau & Sachet (1977) 23; Markgr. (1979) 233; Boiteau & L. Allorge (1981) 47. — Type: *Ochrosia borbonica* J.F. Gmel.

Bleekeria Hassk. emend. Koidz. (1923) 51. — Type: *Bleekeria kalokarpa* Hassk. (= *Ochrosia elliptica* Labill.).

Excavatia Markgr. (1927) 194; (1936) 127. — Lectotype: *Excavatia littoralis* (Merr.) Markgr. (= *Ochrosia ackeringae* (Teijsm. & Binn.) Miq.), designated by Leeuwenberg, 1987.

Fruits apocarpous, rarely syncarpous or hemisyncarpous. *Mericarps* often smooth when dried, often dorsoventrally compressed or biconvex in transverse section. *Endocarps* hard, thick, massive, surrounding 2 lateral cavities.

KEY TO THE SPECIES OF OCHROSIA SECTION OCHROSIA

- 1a. Peduncle of inflorescences not winged. Calyx ciliolate at margin. Fruits syncarpous or hemisyncarpous 2
- b. Peduncle of inflorescences winged (unknown in *O. tenimberensis*). Calyx not ciliolate at margin (unknown in *O. tenimberensis*). Fruits apocarpous 3
- 2a. Branchlets terete, 1–2 mm diameter. Leaf blades ratio 4.2–7.1, secondary veins at an angle of 45–50° to the midrib. Fruits syncarpous **11. *O. syncarpa***
- b. Branchlets subangular to angular upwards, 2–4 mm diameter. Leaf blades ratio 2.1–4.6, secondary veins at an angle of 75–85° to the midrib. Fruits hemisyncarpous **8. *O. ackeringae***
- 3a. Branchlets rather thick, not slender, more than 2 mm diameter. Corolla tube more than 12 mm long (unknown in *O. tenimberensis*). Mericarps 4 cm long or more 4
- b. Branchlets thin, slender, 1–1.5 mm diameter. Corolla tube 4 mm long or less. Mericarps less than 1.5 cm long **10. *O. minima***
- 4a. Leaves papyraceous when dried, apex cuspidate. Mericarps with distinct lateral ridges, strongly dorsoventrally compressed. Seeds 2 at either placenta **9. *O. coccinea***

- b. Leaves coriaceous when dried, apex acute to acuminate. Mericarps without lateral ridges, not compressed dorsoventrally. Seeds 3 at either placenta
 **12. *O. tenimberensis***

8. *Ochrosia ackeringae* (Teijsm. & Binn.) Miq.

Ochrosia ackeringae (Teijsm. & Binn.) Miq. (1869) 138; F. Muell. (1871) 131; Valetton (1895) 229; Pichon (1947) 208; Fosberg, Boiteau & Sachet (1977) 23; Markgr. (1979) 238. — *Lactaria ackeringae* Teijsm. & Binn. (1867) 249. — *Bleekeria ackeringae* (Teijsm. & Binn.) Koidz. (1923) 52. — Type: *Ackeringa s.n.* (holo L), Indonesia, Sumatra, Bangka.

Ochrosia ackeringae (Teijsm. & Binn.) Miq. var. *angustifolia* Baker f. (1900) 182. — Type: not indicated, but the description given by the author refers to *O. ackeringae*.

Ochrosia littoralis Merr. (1909) 315; Merr. (1923) 330; Pichon (1947) 208. — *Bleekeria littoralis* (Merr.) Koidz. (1923) 52. — *Excavatia littoralis* (Merr.) Markgr. (1927) 194. — Type: *Curran & Merritt FB 7754* (holo PNH⁺), Philippines, Luzon, Batangas, Malabrigo. — I have not found any specimen of *Curran & Merritt FB 7754*, but the description given in the protologue (“Drupes united at the base, divaricate . . .”) refers to *O. ackeringae*.

Lactaria calocarpa auct. non Hassk.: Miq. (1862) 553. — Refers to the Teijsmann’s specimen from Poeloe Seboekoe, Sumatra (see Miq. (1869) 138). The description given matches the characters of *O. ackeringae*.

Shrub or tree, 3–10 m high. *Branchlets* terete, usually angular to subangular towards the upper part of the branchlets, thin, 2–4 mm diam., sometimes sulcate, smooth, not lenticellate, glabrous, often blackish when dried. *Leaves* 2- or 3-whorled, coriaceous or papyraceous when dried; petiole 0.4–1.6 cm long, glabrous; blades obovate, elliptic, or narrowly so, 5.5–20 by 2.5–4.4 cm, ratio 2.1–4.6, base decurrent onto petiole, or cuneate, margin entire, apex usually acuminate, sometimes acute or cuspidate, very rarely shallowly retuse, rounded, or truncate; secondary veins inconspicuous, not prominent, more than 35 pairs, 0.1–0.2 cm spaced, at an angle of 75–85° to the midrib, straight to rather arcuate ascending near the margin, not reaching the margin, joining, forming a submarginal vein; tertiary veins indistinct. *Inflorescence* 2.5–10.7 cm long, terminal and axillary cymes, in whorls of 2 or 3, repeatedly dichotomous, loose or congested, glabrous, sometimes with bracts, pedunculate; peduncle 1–6.9 cm long, glabrous. *Flowers* fragrant, 8–20 on each inflorescence; pedicels 2–2.5 mm long, glabrous, bracteolate; bracteoles sepal-like, broadly ovate, 1.1–1.2 by 1.3–1.4 mm, margin entire, apex rounded, rather thin, rough outside, smooth inside, glabrous, 2 or 3 on each pedicel. *Sepals* ovate to broadly so, 1.9–2.3 by 1.5–2 mm, ratio 0.9–1.5, margin ciliolate, apex rounded, middle part of the lower half thick, glabrous, ciliolate outside, smooth inside, connate at base for 0.7 mm. *Corolla* white, in mature buds narrowly ellipsoid, 18 by 2 mm, ratio 9, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 2 mm wide just below the insertion of stamens; tube cylindrical, 12.5 mm long, straight, widening at stamens insertion, and there 2 mm wide, tube-calyx ratio 5.4–6.6, tube-lobes ratio 1; lobes narrowly ovate, 12 by 3 mm, ratio 4, margin entire, apex rounded or acute, glabrous, auriculate on the left side at base. *Stamens* inserted at 3 mm below the mouth, 0.8 of the length of the corolla tube; filaments filiform, 0.5 mm long; anthers ovate, 1.3 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 9 mm long; ovary ovoid, 1.9 by 1 mm, of 2 distinctly separated carpels, widening at base, gradually narrowed at apex towards base of style; style filiform, 6.5 mm long, style-ovary ratio 4–5, split at base; pistil head ovoid, 0.5 by 0.3 mm. *Fruits* hemisyncarpous, V-shaped; mericarps united

at base for 0.5–2.2(–3.2) cm, unequal in size, sometimes only one carpel developing, brown when dried; each mericarp ellipsoid or narrowly so, sometimes narrowly obovoid, 2–4.4 by 0.6–1.9 by 0.5–2 cm, base narrowed or rounded, apex acute or acuminate, acumen short and minute, smooth, glabrous, indehiscent, green and turning red when ripe; endocarps massive, hard, surrounding 2 lateral spongy cavities of 0.3–0.4 cm diameter. *Seeds* 2 or 3 at either placenta, flat, suborbicular to ellipsoid, 0.4–0.9 by 0.3–0.6 cm, apex acuminate, glabrous, whitish brown.

Distribution — In Malesia: Malaysia (Borneo: Sabah), Philippines (Luzon, Palawan, Samar, Babuyan, Mindanao), Indonesia (Sumatra, Java, Sulawesi, Moluccas), Papua New Guinea. Also found in Australia (Christmas Island) and the Solomon Islands.

Habitat & Ecology — Primary forests behind the beach, upper basin, along the riverbanks, or open areas. On sandy soil, or shallow phosphatised limestone scree and brown clay loam. Altitude 0–300 m (mostly found at very low altitudes).

Note — Uniquely characterized by its hemisyncarpous fruits.

9. *Ochrosia coccinea* (Teijsm. & Binn.) Miq.

Ochrosia coccinea (Teijsm. & Binn.) Miq. (1869) 138; F. Muell. (1871) 131; Valetton (1895) 230; Pichon (1947) 208; Fosberg, Boiteau & Sachet (1977) 25; Markgr. (1979) 239. — *Lactaria coccinea* Teijsm. & Binn. (1867) 249. — *Bleekeria coccinea* (Teijsm. & Binn.) Koidz. (1923) 52. — *Excavatia coccinea* (Teijsm. & Binn.) Markgr. (1927) 195. — Type: *Von Rosenberg s.n.* (holo n.v.), Indonesia, Moluccas, Seram.

Shrub or tree, 2–10 m high. *Branchlets* terete, angular towards the upper part of the branchlets, 2–2.5 mm diam., not lenticellate, glabrous, smooth, the topmost branchlets rarely winged; wing occurs longitudinally on opposite sides along the length of the branchlets, leaf-like, asymmetric, 0.2–1 mm wide, greenish, glabrous. *Leaves* 2–4-whorled, papyraceous when dried; petiole 0.3–0.7 cm long, thin, glabrous; blades obovate, sometimes elliptic, to narrowly so, 7–13.3 by 2.5–5.3 cm, ratio 1.7–3.8, base cuneate, margin entire to undulate, apex cuspidate; secondary veins conspicuous, rather prominent, straight around the base, rather arcuate ascending near the margin towards the apex, 25–38 pairs, 0.1–0.3 cm spaced, at an angle of 75° (around the upper half of the blade) to 90° (around the lower half of the blade) to the midrib, not reaching the margin, joining, forming a submarginal vein, tertiary veins not prominent, usually inconspicuous. *Inflorescence* 3.5–5.5 cm long, axillary cymes, solitary or in whorls of 2 or 3, glabrous, with bracts; peduncle 0.6–2(–3.3) cm long, glabrous, winged; wing occurs longitudinally on opposite sides along the length of the peduncle, leaf-like, asymmetric, 0.2–0.8 mm wide, greenish, glabrous. *Flowers* pedicellate; pedicels 1.3–1.5 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1 by 1 mm, apex rounded to acute, smooth inside, glabrous, 2 or 3 on each pedicel. *Sepals* ovate, 2 by 1 mm, ratio 2, margin entire, apex rounded, rather thin, glabrous, smooth inside, connate at base for 0.4 mm. *Corolla* yellow or white, in mature buds narrowly ellipsoid, 13.5 by 2 mm, ratio 6.7, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 2 mm wide just below the insertion of stamens; tube cylindrical, 13 mm long, straight, widening at stamens insertion, and there 2 mm wide, narrower towards the base, tube-calyx ratio 6.5, tube-lobes ratio 1.6; lobes elliptic, 8 by 2.5–3 mm, ratio 2.7–3.2, margin entire, apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 4 mm below the mouth, 0.7 of the length of the

corolla tube; filaments filiform, 0.8 mm long; anthers ovate to narrowly so, 1.5 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 8.5 mm long; ovary ovoid, 1.5 by 0.8 mm, widening at base, gradually narrowed at apex towards base of style, of 2 distinctly separated carpels; style filiform, 6.5 mm long, style-ovary ratio 4.3, split at base; pistil head ovoid, 0.5 mm long. *Fruits* apocarpous, composed of 2 separate mericarps; mericarps brownish when dried, boat-shape, 4–4.6 by 2–2.9 by 1–1.1 cm, strongly dorsoventrally compressed, base long cuneate, apex rounded and sometimes abruptly acuminate, acumen tiny, with distinct apical and lateral ridges, longitudinally shallowly grooved along the middle on both dorsal and ventral surfaces, smooth, glabrous, slightly glossy, indehiscent, green turning bright red or sometimes crimson when ripe; endocarps massive, thick, hard, surrounding 2 spongy cavities of 0.5–0.9 cm diameter. *Seeds* 2 at either placenta, flat, ellipsoid, unequal in size, 1–1.7 by 0.5–0.8 cm, apex acute, glabrous, brownish.

Distribution — In Malesia: Indonesia (Moluccas and West Papua), and Papua New Guinea (East Sepik, Morobe).

Habitat & Ecology — Primary and secondary rain forests. On clayey soil. Altitude 0–1000 m.

Notes — 1. Holotype specimen is not found. It was probably in BO.

2. Specimens with complete inflorescence are not available.

3. Characterized by its papyraceous and cuspidate leaves.

10. *Ochrosia minima* (Markgr.) Fosberg & Boiteau

Ochrosia minima (Markgr.) Fosberg & Boiteau in Fosberg, Boiteau & Sachet (1977) 27; Markgr. (1979) 240; P.I. Forst. (1993) 15. — *Excavatia minima* Markgr. in Merr. & L.M. Perry (1940) 199. — *Bleekeria minima* (Markgr.) Merr. & L.M. Perry (1943) 214. — Type: *Brass* 8512 (holo B†; lecto A, designated by Markgraf, 1979; iso BO, BRI, L), Papua New Guinea, Tarara, Wasi Kussa River.

Shrub, 5 m high. *Branchlets* terete, thin, slender, 1–1.5 mm diam., not lenticellate, glabrous, blackish when dried. *Leaves* 2- or 3-whorled, papyraceous when dried, shortly petiolate; petiole 0.6–1 cm long, glabrous; blades obovate, 5.5–10 by 3–4.4 cm, ratio 1.8–2.8, base decurrent onto petiole, margin entire, apex acute or acuminate; secondary veins inconspicuous, not prominent, 20–24 pairs, 0.2–0.4 cm spaced, at an angle of 75–85° to the midrib, straight to rather arcuate ascending near the margin, not reaching the margin, joining, forming a submarginal vein; tertiary veins not prominent, inconspicuous. *Inflorescence* terminal cymes, glabrous, with bracts; peduncle 3.5–6 cm long, glabrous, winged; wing very narrow, 1–1.5 mm wide, occurs on opposite sides along the length of peduncle, leaf-like, yellowish, glabrous. *Flowers* pedicellate; pedicels 1–3.5 mm long, glabrous, bracteolate; bracteoles sepal-like, clasping the pedicels, triangular to broadly so, 1–1.1 by 0.9–1 mm, margin entire, apex acute or rounded, slightly rough outside, smooth inside, glabrous on both sides, 2 or 3 on each pedicel. *Sepals* ovate, 1.8–2 by 0.7–0.9 mm, ratio 2.3, margin entire, apex rounded, erect, thick except along the margin, glabrous on both sides, rough outside, smooth inside, connate at base for 1 mm. *Corolla* glabrous outside, villose inside, rather dense, forming a belt of 1 mm wide just around the insertion of stamens; tube cylindrical, 3.9–4 mm long, straight, slightly widening at the stamens insertion, and there 2 mm wide, tube-calyx ratio 2–2.2, tube-lobes ratio 1.2–1.3; lobes elliptic, 3–3.2 by 1.5 mm, ratio 2–2.1, margin entire,

apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 2–3 mm below the mouth, 0.5 of the length of the corolla tube; filaments filiform, 0.4–0.5 mm long; anthers ovate, 1.4–1.5 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 3.1 mm long; ovary subglobose, 1 by 1 mm, widening at base, gradually narrowed at apex towards base of style, of 2 distinctly separated carpels; style filiform, 1.4 mm long, style-ovary ratio 1.4, thick, split at base; pistil head ovoid, 0.6 by 0.3 mm. *Fruits* apocarpous, composed of 2 separate small mericarps; mericarps glossy red when fresh, blackish brown or light brown when dried, ellipsoid, 1.2–1.4 by 0.6–1 cm, apiculate at the apex, acumen very short, smooth, glabrous, indehiscent, red when ripe; endocarps massive, hard, surrounding 2 lateral spongy cavities which are occupying the whole space at either side of the seed chamber.

Distribution — Malesia: Papua New Guinea. Also found in Australia (Queensland).

Habitat & Ecology — In rain forests, or notophyll vineforests on white sandy soil. Altitude 120 m.

Notes — 1. Uniquely characterized by its small mericarps.

2. This species has been very infrequently collected in Malesia. There are a few additional collections from Australia.

3. Specimens with complete inflorescence are not available.

11. *Ochrosia syncarpa* Markgr.

Ochrosia syncarpa Markgr. (1979) 237. — Type: *Kostermans 22012* (holo L; iso A, BO), Indonesia, Nusa Tenggara Timur, Flores.

Shrub, 6 m high. *Branchlets* terete, thin, 1–2 mm diam., not lenticellate, glabrous, smooth. *Leaves* 3-whorled, papyraceous when dried, shortly petiolate; petiole 0.4–1 cm long, glabrous; blades narrowly elliptic to narrowly obovate, 5–8.3 by 1–1.7 cm, ratio 4.2–7.1, base decurrent into petiole, margin entire, apex acute; secondary veins inconspicuous, not prominent, straight, 18–30 pairs, 0.1–0.3 cm spaced, at an angle of 45–50° to the midrib, not reaching the margin, joining, forming a submarginal vein; tertiary veins indistinct. *Inflorescence* 2–3.4 cm long, terminal and axillary cymes, solitary or in whorls of 2 or 3, loose, glabrous, sometimes with bracts; peduncle 1–2.1 cm long, thin, slender, glabrous. *Flowers* pedicellate; pedicels 2 mm long, glabrous, bracteolate; bracteoles sepal-like, ovate, 1.1 by 0.8 mm, apex rounded, thick at the middle of basal part, ciliolate outside, smooth inside, glabrous, 1 or 2 on each pedicel. *Sepals* ovate, unequal in size, 1.8–2 by 1–1.1 mm, ratio 1.6–1.8, margin ciliolate, apex rounded, thick at the middle-basal part, thin along the margin, ciliolate outside, smooth inside, glabrous, connate at base for 0.7 mm. *Corolla* white, in mature buds narrowly ellipsoid, 12 by 2 mm, ratio 6, of which the lobes form a rounded apex, glabrous outside, villose inside, rather dense, forming a belt of 1.5 mm wide just below the insertion of stamens; tube cylindrical, 10 mm long, straight, widening at stamens insertion, and there 2 mm wide, narrower towards the base, tube-calyx ratio 5–5.6, tube-lobes ratio 1.4; lobes obovate, 7 by 2.8 mm, ratio 2.5, margin entire, apex rounded, glabrous. *Stamens* inserted at 2–2.5 mm below the mouth, 0.7–0.8 of the length of the corolla tube; filaments filiform, 0.5 mm long; anthers ovate to narrowly so, 1–1.1 by 0.8 mm, sagittate at base, apex acute, yellowish when dried. *Pistil* glabrous, 5.6 mm long; ovary ovoid, 1 by 0.7 mm, widening at base, gradually narrowed at apex towards base of style, of

2 distinctly separated carpels; style filiform, 4.1–6 mm long, style-ovary ratio 4.1–6, split at base; pistil head ovoid, 0.5 mm long. *Fruits* syncarpous, blackish brown when dried, ovoid, 1.7–3 by 1–1.5 by 1.2–1 cm, base rounded, apex acute, smooth, glabrous, slightly glossy, indehiscent, green when unripe; endocarps massive, hard, surrounding 4 spongy cavities of about 0.3 cm diameter. *Seeds* 2 at either placenta, flat, ellipsoid, 0.6 by 0.3 cm, apex acuminate, glabrous, whitish.

Distribution — Malesia: Indonesia (Nusa Tenggara).

Habitat & Ecology — Dry places. Altitude 0–700 m.

Note — Uniquely characterized by its syncarpous fruit.

12. *Ochrosia tenimberensis* Markgr.

Ochrosia tenimberensis Markgr. (1979) 239. — Type: *Pleyte* 72 (holo L; iso A), Indonesia, Moluccas, Tanimbar Islands, Jamdena, Saumlaki.

Shrub, 3–10 m high. *Branchlets* terete, angular towards the upper part of the branchlets, 4–5 mm diam., sometimes sulcate when dried, not lenticellate, glabrous. *Leaves* usually 4-whorled, rarely 3- or 5-whorled, coriaceous when dried, shortly petiolate; petiole 0.3–2.2 cm long, glabrous; blades elliptic to narrowly so, 8.5–19.5 by 3.3–6.3 cm, ratio 2.1–3.3, base decurrent into petiole, margin entire sometimes rather undulate, apex gradually acuminate or acute, secondary veins conspicuous, not prominent, 27–42 pairs, 0.2–0.5 cm spaced, at an angle of 75° to the midrib, usually straight, sometimes straight and rather arcuate ascending near the margin, not reaching the margin, joining, forming a submarginal vein, tertiary veins not prominent, conspicuous, reticulate. *Flowers* white or yellowish white. *Fruits* apocarpous, composed of 2 separate mericarps; mericarps brown when dried, obovoid to ellipsoid, 4–4.7 by 1.7–2 by 1.3–1.7 cm, base narrowed, apex apiculate, acumen 3 mm long, smooth, glabrous, indehiscent, green and turning red when ripe; endocarps massive, hard, whitish, surrounding 2 spongy cavities of about 0.5 cm diameter. *Seeds* 3 at either placenta, flat, ellipsoid, unequal in size, the first two 0.8–1.1 by 0.6–0.9 cm, the third one 0.7 by 0.3 cm, apex acuminate or rounded, glabrous, whitish.

Distribution — Malesia: Indonesia (Moluccas).

Habitat & Ecology — Coastal forests or open areas at low altitude.

Notes — 1. Specimens with mature buds, open flowers, and inflorescences are not available.

2. In the protologue of this species, Markgraf designated *Pleyte* 72 (deposited in L) as the holotype, but the holotype label (with his handwriting on it) was attached on the sheet of the wrong specimen (*Pleyte* 128, also deposited in L).

SECTION UNKNOWN

13. *Ochrosia basistamina* Hendrian, *spec. nov.* — Fig. 2

Ramuli subangulares vel angulares 8–10 cm diametra. Folia 4- ad 6- vel 7-verticillata, coriacea, petiolus 2–5.5 cm longus, lamina anguste obovata vel obovata vel elliptica, 14–29 × 5.5–10.1 cm, venae camptodromae. Inflorescentiae 9.5–18.5 cm longae. Corollae tubus 10 × 2 mm, lobi elliptici, 12–12.5 × 3 mm. Stamina in basi tubo insertae. Ovarium 1 mm altum. Fructus ignotus. — Typus: *Boschproefstation* 408 (holo L; iso A), Indonesia, South Sulawesi, Malili.

Fig. 2. *Ochrosia basistamina* Hendrian. a. Leaves; b. leaves and inflorescences; c. sepals; d. stamens insertion (a: *Boschproefstation 333*, L; b–d: *Boschproefstation 408*, L).

Branchlets subangular to angular, thick, 8–10 mm diam., sulcate when dried, smooth, not lenticellate, glabrous, with conspicuous leaf scars. *Leaves* 4–6(–7)-whorled, coriaceous to thickly so when dried, long petiolate; petiole 2–5.5 cm long, glabrous; blades usually narrowly obovate, sometimes obovate or elliptic, 14–29 by 5.5–10.1 cm, ratio 2–3.1, base cuneate, margin entire, sometimes rather undulate, apex abruptly acuminate, rarely rounded; secondary veins conspicuous, rather prominent, 12–19 pairs, 0.5–2.1 cm spaced, at an angle of 50–80(–90)° to the midrib, arcuate ascending, not reaching the margin, usually not joining, rarely joining, not forming a submarginal vein; tertiary veins not prominent, conspicuous on abaxial side only, reticulate. *Inflorescence* 9.5–18.5 cm long, terminal and axillary cymes, in whorls of 2–5, congested, glabrous, long pedunculate; peduncle 6.5–12.5 cm long, glabrous. *Flowers* more than 30 on each inflorescence, fairly long pedicellate; pedicels 3 mm long, glabrous. *Sepals* suborbicular to orbicular, 2.1 by 2.1 mm, ratio 1, margin entire to undulate, apex blunt, rather thin except at the middle-basal part, rather rough outside, smooth inside, glabrous, connate at base for 0.6 mm. *Corolla* in mature buds narrowly ellipsoid, 20 by 2–2.5 mm, ratio 8–10, of which the lobes form a rounded apex, glabrous outside, villose inside, sparse, forming a belt of 3 mm wide just around the insertion of stamens; tube cylindrical, 10 mm long, straight, tube-calyx ratio 4.8, tube-lobes ratio 0.8; lobes narrowly elliptic, 12–12.5 by 3 mm, ratio 4–4.2, margin entire, apex rounded, glabrous, auriculate on the left side at base. *Stamens* inserted at 8 mm below the mouth, 0.2 of the length of the corolla tube; filaments filiform, 1 mm long; anthers ovate to narrowly so, 1.5 by 0.5 mm, sagittate at base, apex acute, yellowish when dried. *Ovary* ovoid, widening at base, apex rounded and abruptly narrowed at base of style, 1 by 1 mm, of 2 distinctly separated carpels; style filiform, 3.7 mm long, style-ovary ratio 3.7, not split at base.

Distribution — Malesia: Indonesia (Sulawesi).

Habitat & Ecology — Altitude 200 m.

Notes — 1. Specimens with fruits are not available. Therefore, the position of this species at the sectional level is still unknown.

2. The species is characterized by the absence of a submarginal vein, its suborbicular to orbicular sepals, and the insertion of stamens near the base (only 0.2 of the length of the corolla tube).

3. It appears to be most similar to *O. ficifolia* in having arcuate ascending secondary veins and in the absence of a submarginal vein (the submarginal vein is present in other *Ochrosia* species). But they are different in inflorescence length (which is shorter in *O. ficifolia*), blade texture (coriaceous to thickly so when dried vs. papyraceous in *O. ficifolia*), the phyllotaxis (usually 5- or 6-whorled vs. 2–4-whorled in *O. ficifolia*), and sepals (suborbicular to orbicular vs. ovate in *O. ficifolia*).

4. These specimens were all collected from Malili, South Sulawesi. Two of them previously recognized as *O. oppositifolia* by Markgraf (1979), Leeuwenberg (determination of *Boschproefstation* 408 of A (1992) and L (1986) specimens), and Fosberg (determination of *Boschproefstation* 408 of A specimens, 1976). However, in *O. oppositifolia* the submarginal vein is always present (usually close to the margin, but distinctly recognisable), the secondary veins are many (21 to more than 40 pairs), the corolla tube is much shorter, and the stamen insertion is at about the middle (0.5–0.7 of the length of the corolla tube).

Specimens examined: INDONESIA: *Boschproefstation 333* (L), Sulawesi: South Sulawesi, Malili; *Boschproefstation 408* (A, L, type), Sulawesi: South Sulawesi, Malili; *Neth. Ind. For. Service 220* (A), Sulawesi: South Sulawesi, Malili.

ACKNOWLEDGEMENTS

This work was enabled by the STUNED Scholarship Programme organised by the Netherlands Education Centre (NEC).

I am most grateful to Prof. Pieter Baas for his invaluable support; and to Dr. Marco Roos, Dr. David J. Middleton and Dr. A.J.M. Leeuwenberg for their supervision.

I would like to thank Dr. Frits Adema and Dr. Peter van Welzen for their help and assistance; and all colleagues at the Nationaal Herbarium Nederland, Universiteit Leiden branch, for their help and hospitality. I also wish to thank the directors and curators of the following herbaria whose material has been consulted: A, BM, BO, CANB, GH, K, L, M, NSW, P, UC, WAG, and WRSL. Finally I would like to express my deepest gratitude to Miet van de Wiele, Audrey Selzner and Elena Kamilarova for helping me to translate some articles from French and Dutch to English; and Mr. Jan van Os and Mrs. Anita W. Sachs for the nice drawing.

INDEX

Numbers refer to the species number as used in this paper. The genus name and its synonyms has been referred to page numbers. New names are in **bold**, accepted names in roman, and synonyms in *italics*.

- Alstonia ficifolia* S. Moore 4
Bleekeria Hassk. [p. 104, 116]
ackeringae (Teijsm. & Binn.) Koidz. 8
coccinea (Teijsm. & Binn.) Koidz. 9
littoralis (Merr.) Koidz. 8
minima (Markgr.) Merr. & L.M. Perry 10
salubris (Raf.) Hassk. 6
Calpicarpum G. Don [p. 104, 107]
lamarckii G. Don 6
oppositifolium (Lam.) Boiteau 6
Cerbera oppositifolia Lam. 6
platyspermos Gaertn. 6
salutaris Lour. 6
Excavatia Markgr. [p. 104, 116]
coccinea (Teijsm. & Binn.) Markgr. 9
littoralis (Merr.) Markgr. 8
minima Markgr. 10
Kopsia lamarckii B.D. Jacks. 6
Lactaria Rumph. ex Raf. [p. 104, 107]
ackeringae Teijsm. & Binn. 8
acuminata (Trimen ex Valetton) Koidz. 1
calocarpa auct. 8
coccinea Teijsm. & Binn. 9
glomerata (Blume) Koidz. 5
oppositifolia (Lam.) Kuntze 6
salubris Rumph. ex Raf. 6
Neisosperma Raf. [p. 104, 106]
acuminata (Trimen ex Valetton) Fosberg & Sacht 1
var. *acuminata* 1
var. *apoense* (Elmer) Markgr. 2
apoensis (Elmer) Fosberg & Sacht 2
citrodora (Lauterb. & K. Schum.) Fosberg & Sacht 3
ficifolia (S. Moore) Fosberg & Sacht 4
glomerata (Blume) Fosberg & Sacht 5
muricata Raf. 6
oppositifolia (Lam.) Fosberg & Sacht 6
rudis (Markgr.) Fosberg & Sacht 4
sciadophylla (Markgr.) Fosberg & Sacht 7
Ochrosia Juss. [p. 104]
sect. *Echinocaryon* F. Muell. [p. 104, 106]
sect. *Lactaria* F. Muell. [p. 104, 116]
sect. *Ochrosia* [p. 104, 116]
sect. *Phragmochrosia* Pichon [p. 104, 107]
subg. *Echinocaryon* Valetton [p. 104, 106]
subg. *Lactaria* (F. Muell.) Valetton [p. 104, 116]
ackeringae (Teijsm. & Binn.) Miq. 8
var. *angustifolia* Baker f. 8
acuminata Trimen ex Valetton 1
apoensis Elmer 2
basistamina Hendrian 13
borbonica auct. 6
citrodora Lauterb. & K. Schum. 3
coccinea (Teijsm. & Binn.) Miq. 9
cowleyi F.M. Bailey 6
elliptica auct. 6
ficifolia (S. Moore) Markgr. 4
glomerata (Blume) F. Muell. 5
littoralis Merr. 8
minima (Markgr.) Fosberg & Boiteau 10
oppositifolia (Lam.) K. Schum. 6
parviflora sensu Markgr. 6
platyspermos (Gaertn.) A.DC. 6
rudis Markgr. 4
salubris (Raf.) Blume 6
sciadophylla Markgr. 7
syncarpa Markgr. 11
tenimberensis Markgr. 12
Ochrosia sensu Fosberg & Sacht [p. 104, 116]
Ochrosia sensu Markgr. [p. 107]
Ochrosion platyspermum (Gaertn.) St.-Lag. 6
Paralstonia clusiacea auct. 3
Pseudochrosia Blume [p. 104, 107]
glomerata Blume 5
